

# **Reliability Study Update**

## **High Pressure Safety Injection**

### **1987–2005**

This report presents a performance evaluation of the High Pressure Safety Injection (HPI) system at 69 operating United States commercial pressurized-water reactors (PWRs). The evaluation is based on the operating experience from 1987 through 2005, from 74 PWRs, as reported in Licensee Event Reports (LERs). This is the latest update to NUREG/CR-5500 Volume 9, updating data, availability and reliability estimates, trends, and figures.

This report calculates two basic models for the HPI system. The first model, failure to start (FTS), models the HPI system start and injection. The second model, 8-hour mission, models the HPI system start, injection, and pump run for 8 hours. See the HPI Fault Tree Description document for more detail.

The HPI system has been categorized into six groups. The groupings are based on the number of injection points (as measured by the number of steam generators (SGs) or the number of cold legs), the number of high-head safety injection (HHSI) pumps, and the number of intermediate-head safety injection pumps (IHSI). [Table 1](#) summarizes those groups. Information that is more detailed, including segment counts and success criteria, can be found in [Section 5](#).

**Table 1. HPI design class summary.**

HPI Design Class	Number of Plants		Number of Plants		
	In Study	Operating	In Study	Operating	
1 - (2 HHSI or 2 IHSI; 2 SGs)	20	19	5 - (3 IHSI; 4 SGs)	4	4
2 - (3 HHSI or 3 IHSI; 2 SGs)	8	8	6 - (2 HHSI, 2 IHSI; 4 SGs)	28	25
3 - (2 HHSI or 2 IHSI; 3 SGs)	12	11			
4 - (4 IHSI; 3 SGs)	2	2			

## **1 LATEST VALUES AND TRENDS**

### **1.1 Industry-Wide Unavailability and Unreliability**

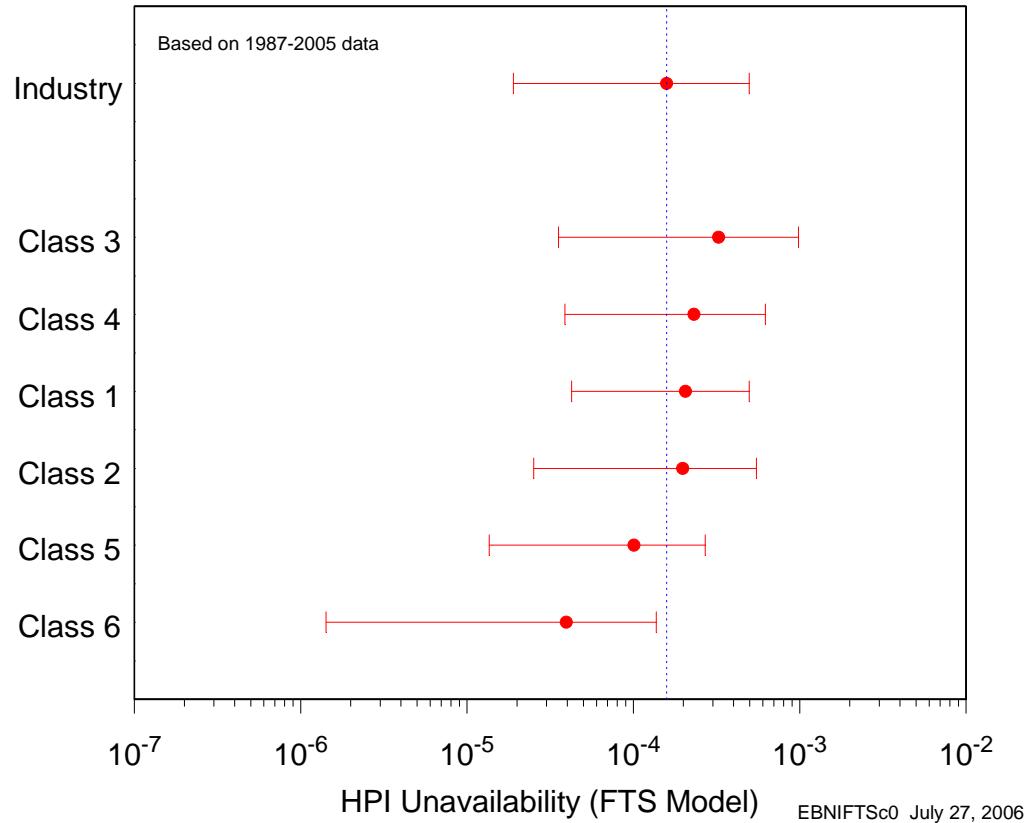

The industry-wide unavailability and unreliability of the HPI system have been estimated from operating experience. A failure to start (FTS) unavailability and an 8-hour mission unreliability were evaluated, see [Table 2](#). The estimates are based on failures that occurred during safety injection demands.

**Table 2. Industry-wide values.**

Model	Lower (5%)	Mean	Upper (95%)
Failure-to-Start (Unavailability)	1.90E-05	1.59E-04	4.96E-04
8-hour Mission (Unreliability)	3.76E-05	1.01E-03	3.78E-03

## 1.2 Fail to Start Model Results

The unavailability of the HPI system for each design class has been calculated from the operating experience for the failure to start (FTS) mission. The waterfall plot is shown in [Figure 1](#) and the data table is shown in [Table 3](#). Due to the sparseness of the data, between-plant variation of failure probabilities is not meaningful and the plant waterfall plot is not shown.

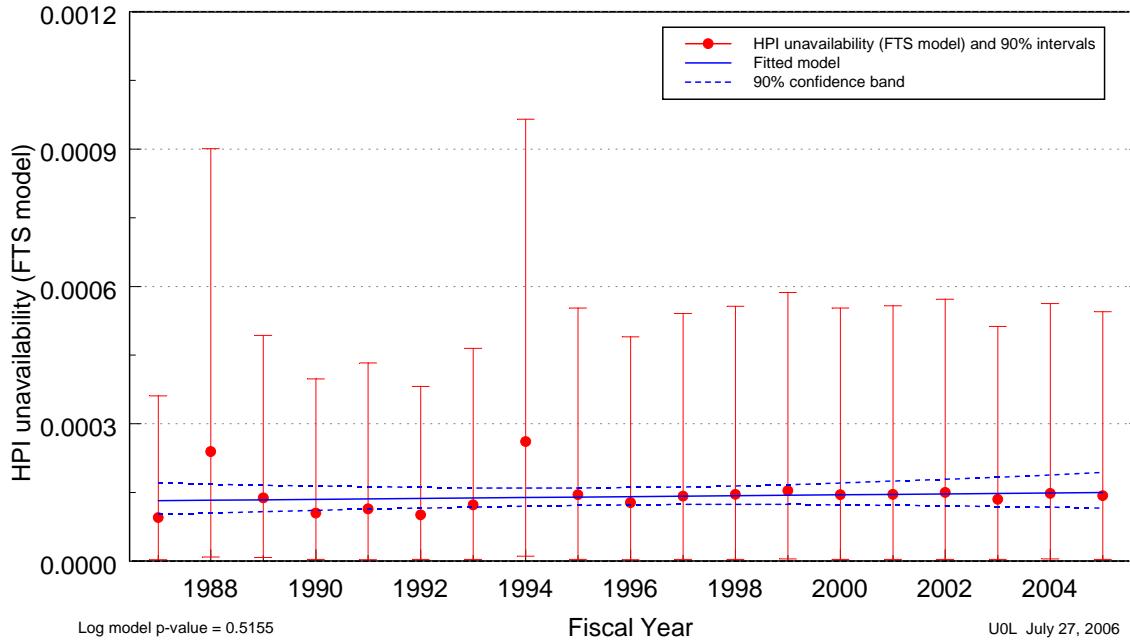

**Figure 1. HPI design class unavailability (FTS model).**

**Table 3. HPI unavailability (start only model) by design class.**

Plant	Lower (5%)	Mean	Upper (95%)
Industry	1.90E-05	1.59E-04	4.96E-04
Class 3	3.55E-05	3.26E-04	9.84E-04
Class 4	3.87E-05	2.31E-04	6.20E-04
Class 1	4.25E-05	2.06E-04	4.97E-04
Class 2	2.52E-05	1.98E-04	5.50E-04
Class 5	1.36E-05	1.01E-04	2.71E-04
Class 6	1.42E-06	3.96E-05	1.37E-04

[Figure 2](#) displays the trend by fiscal year of the HPI system FTS unavailability calculated from the 1987–2005 experience. [Table 8](#) shows the data points for [Figure 2](#). The trend is not considered statistically significant.<sup>1</sup>

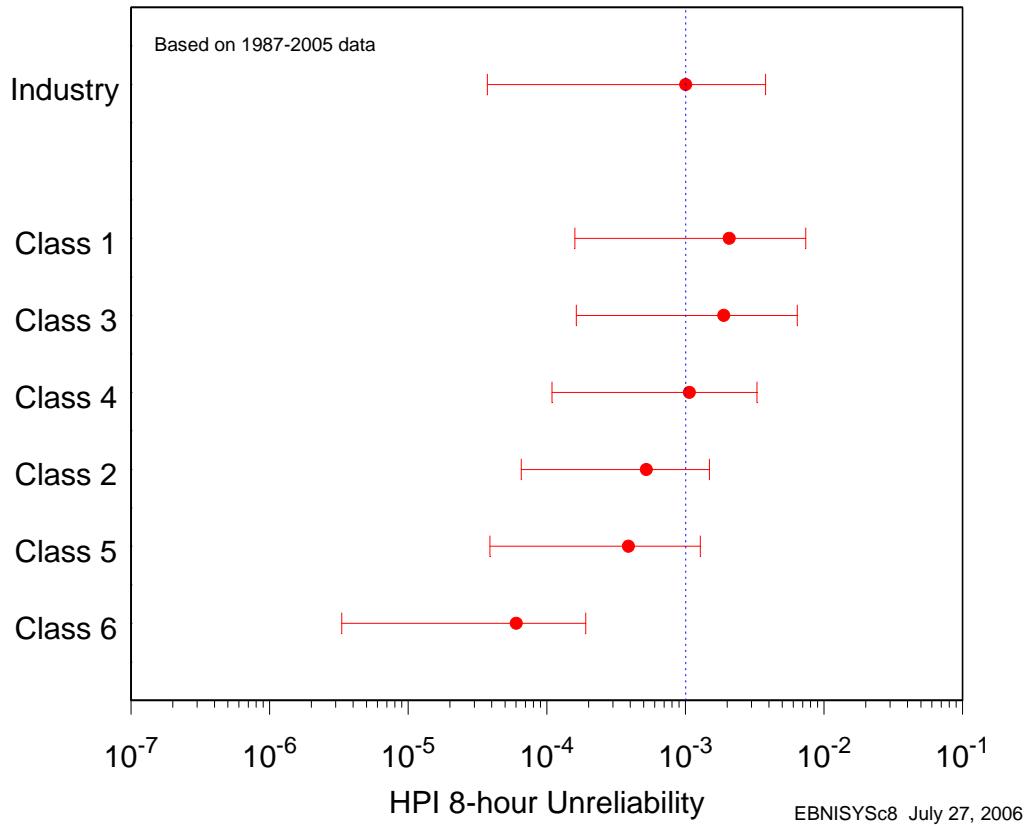

**Figure 2.** Trend of HPI system unavailability (FTS model), as a function of fiscal year.

### 1.3 Fail to Operate for 8-Hour Model

The unreliability of the HPI system for each design class has been calculated from the operating experience for the 8-hour mission. The waterfall plot is shown in [Figure 3](#) and the data table is shown in [Table 4](#). Due to the sparseness of the data, between-plant variation of failure rates is not meaningful and the plant waterfall plot is not shown.

---

<sup>1</sup>Statistically significant is defined in terms of the ‘p-value.’ A p-value is a probability indicating whether to accept or reject the null hypothesis that there is no trend in the data. P-values of less than or equal to 0.05 indicate that we are 95% confident that there is a trend in the data (reject the null hypothesis of no trend.) By convention, we use the “Michelin Guide” scale: p-value < 0.05 (statistically significant), p-value < 0.01 (highly statistically significant); p-value < 0.001 (extremely statistically significant).

**Figure 3. HPI design class unreliability (8-hour model).**

**Table 4. HPI unreliability (8-hour model) by design class.**

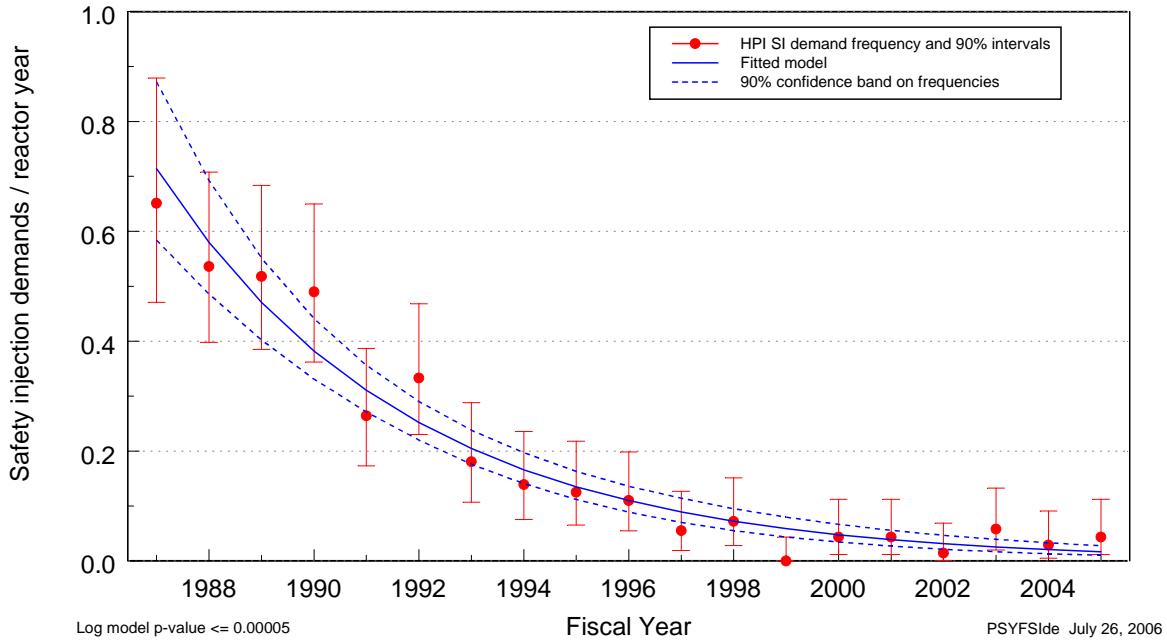

Plant	Lower (5%)	Mean	Upper (95%)
Industry	3.76E-05	1.01E-03	3.78E-03
Class 1	1.59E-04	2.07E-03	7.37E-03
Class 3	1.63E-04	1.89E-03	6.41E-03
Class 4	1.09E-04	1.07E-03	3.28E-03
Class 2	6.55E-05	5.23E-04	1.49E-03
Class 5	3.89E-05	3.88E-04	1.28E-03
Class 6	3.31E-06	6.04E-05	1.91E-04

Normally, there would be a system unreliability trend in this section. However, the HPI unplanned demand data set for the 8-hour mission time is extremely sparse. In fact, no failures to run of HPI pumps during safety injection demands (the highest contribution to system failure for the 8-h unreliability is motor-driven pump failure-to-run, Section 3.1.2) were observed during the 1987–2005 period. Therefore, with no observed failures to run, trending the estimated industry average fail to run unreliability is not meaningful. The current estimated industry average unreliability is 1.01 E-03.

## 2 DATA TRENDS

### 2.1 Unplanned Demand Trend

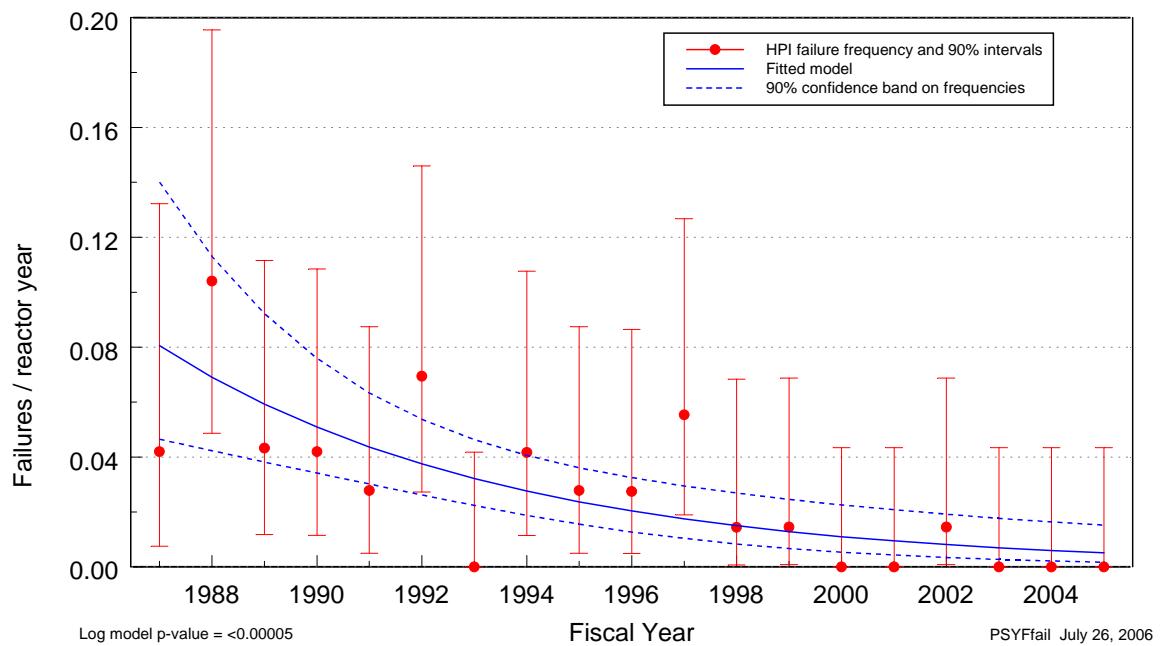

Trends were identified in the frequency of HPI unplanned safety injection (SI) demands (Figure 4). When modeled as a function of fiscal year, the unplanned SI demand frequency exhibited an extremely statistically significant decreasing trend. Table 9 shows the LERs that are represented in the figure.

**Figure 4. Frequency (events per reactor year) of unplanned SI demands, as a function of fiscal year.**

### 2.2 Failure Trend

The frequency of all failures (unplanned SI demands, surveillance tests, inspections, etc.) resulting in train unavailability identified in the experience was analyzed to determine trends. When modeled as a function of fiscal year, a highly statistically significant decreasing trend was identified. The fitted frequency is plotted against fiscal year in Figure 5. Trends for HPI failures are plotted without regard to method of detection (the trend excludes maintenance out of service and support system failures). Table 10 shows the LERs that are represented in the figure.

**Figure 5. Frequency (events per reactor year) of failures, as a function of fiscal year.**

### 3 MAJOR CONTRIBUTORS TO SYSTEM UNRELIABILITY AND UNAVAILABILITY

#### 3.1 Segment Failure Contribution to Design Class Models

The segment failure importance has been determined by calculating the Fussell-Veseley importance of groups of basic events for each design class fault tree model.

##### 3.1.1 Fail to Start Model

Figure 6 through Figure 11 show the distributions of segment importances for the FTS model. The top segment importance varies between the Design Classes. Design Classes 1 and 5 have the common-cause pump fail-to-start as the top segment importance. Design Classes 2, 3, and 4 have the common-cause injection header MOVs as the top segment importance. Design Class 6 shows the actuation channel as the top segment importance (Design Classes 3 and 6 have a running charging pump and do not require any pump start for this model, except on failure of the running pump).

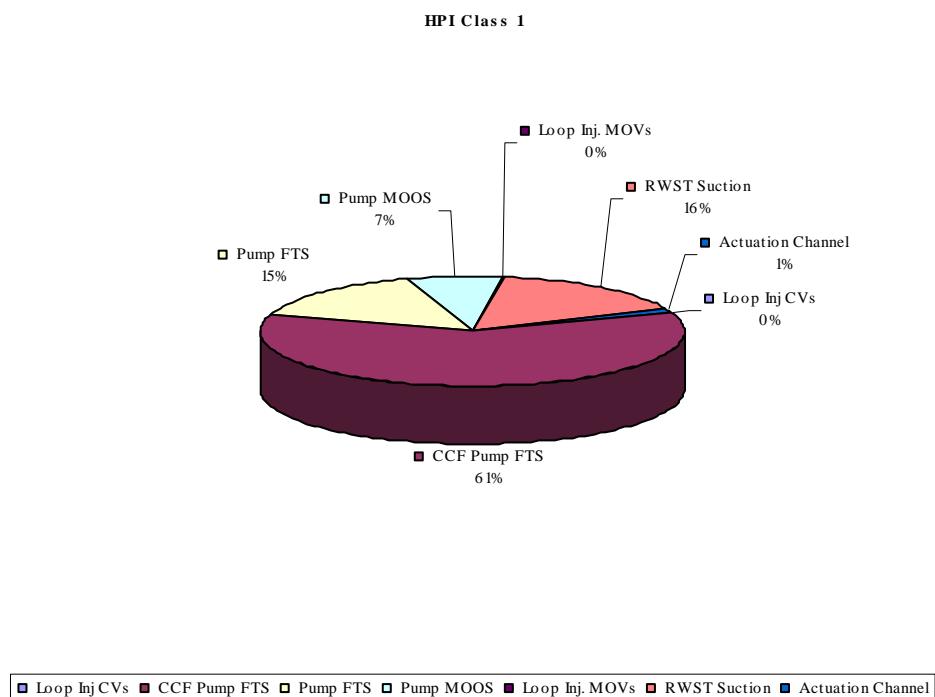

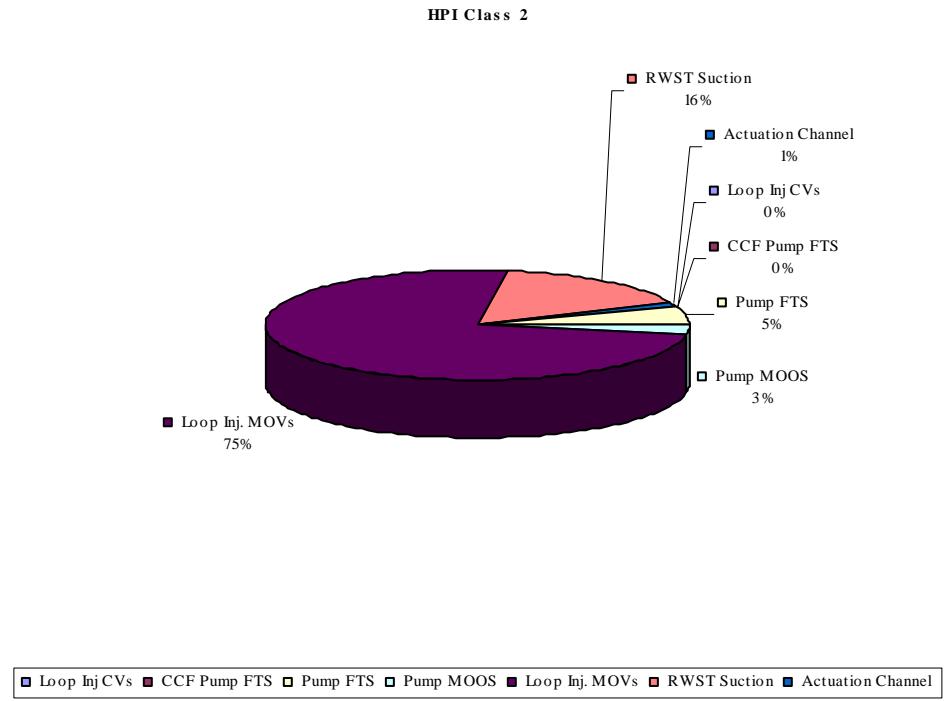

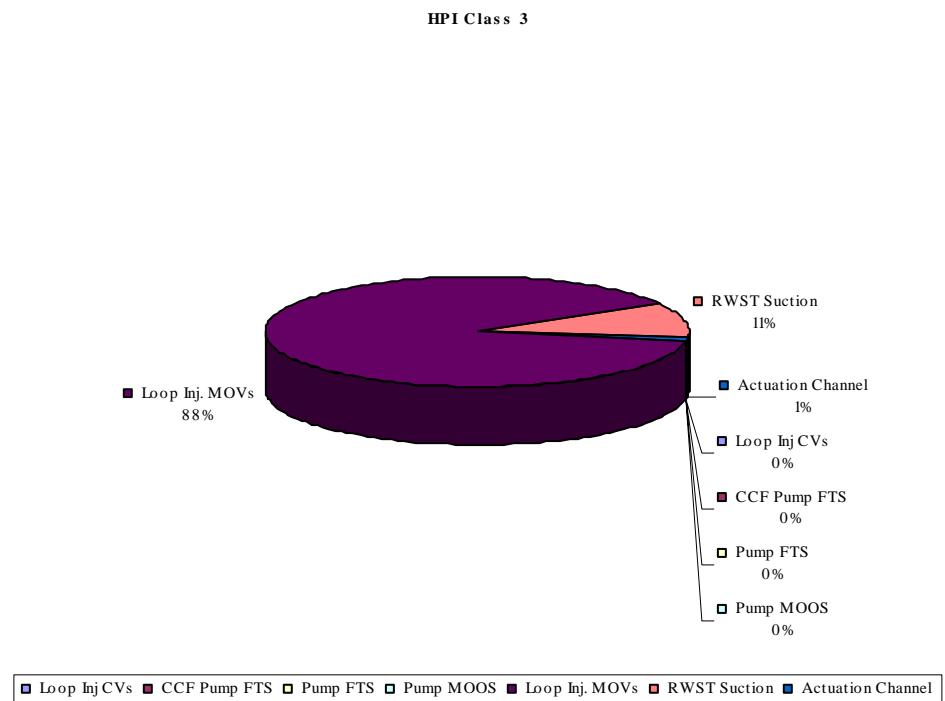

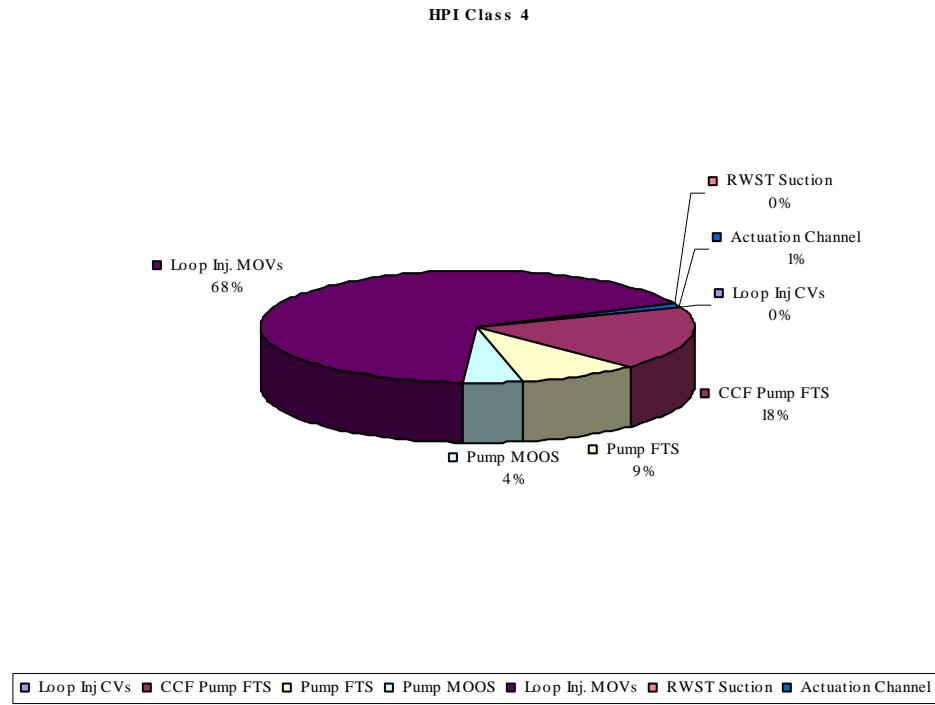

Figure 6. Segment importance distribution, FTS model Design Class 1.

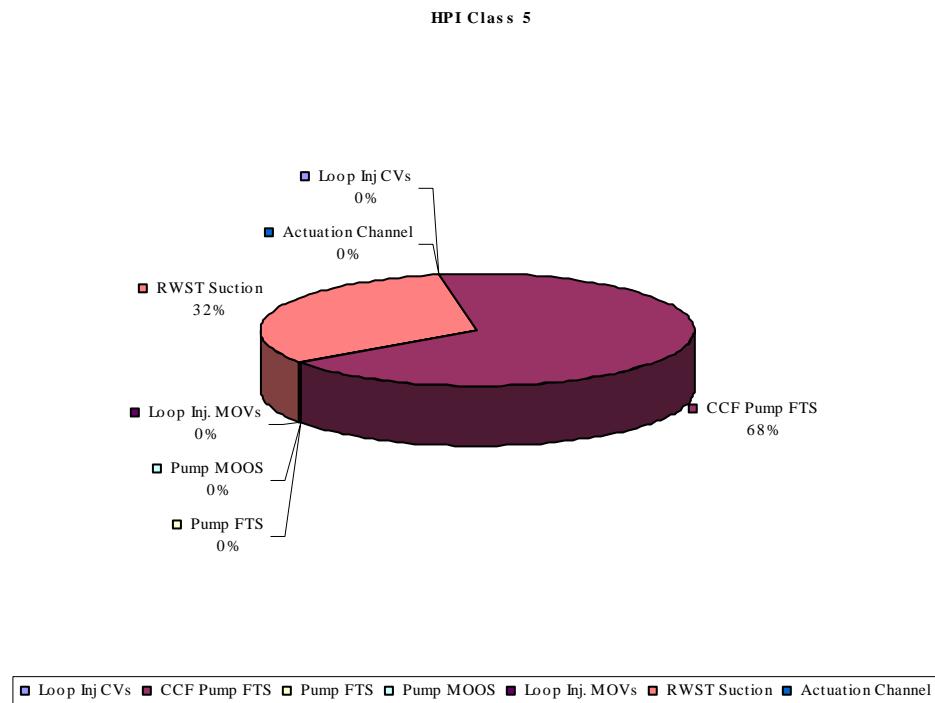

**Figure 7. Segment importance distribution, FTS model Design Class 2.**

**Figure 8. Segment importance distribution, FTS model Design Class 3.**

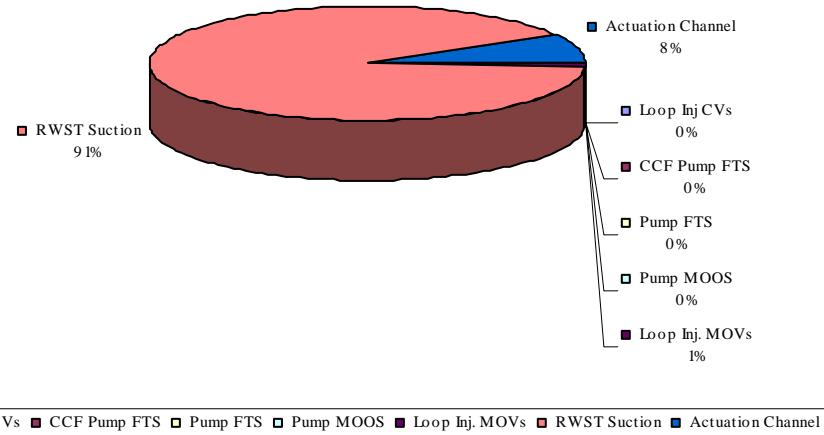

**Figure 9. Segment importance distribution, FTS model Design Class 4.**

**Figure 10. Segment importance distribution, FTS model Design Class 5.**

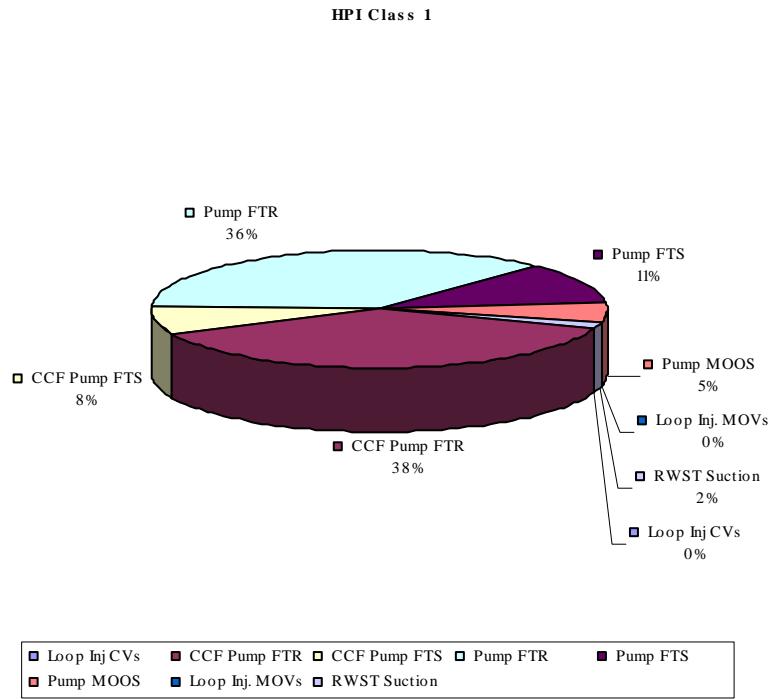

HPI Class 6

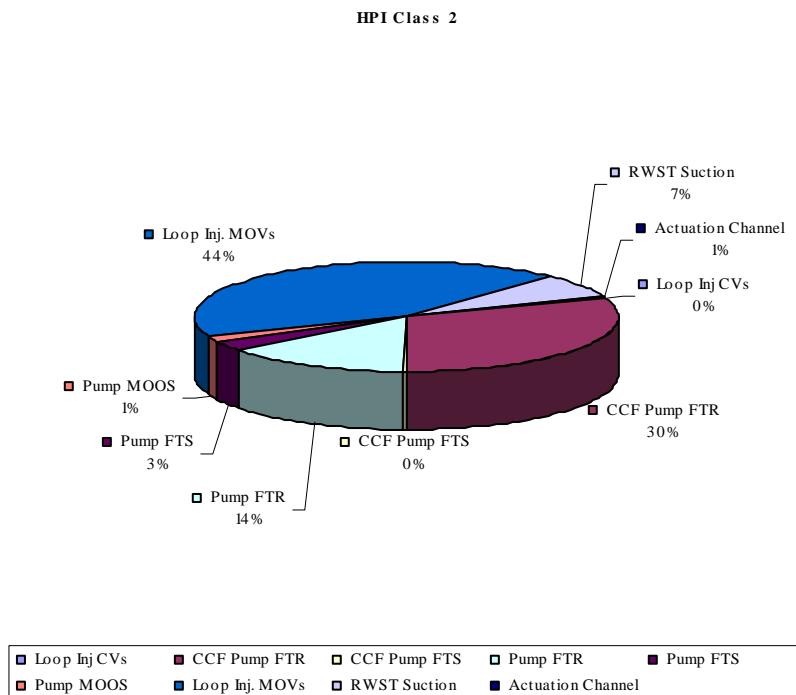

**Figure 11. Segment importance distribution, FTS model Design Class 6.**

### 3.1.2 Fail to Operate for 8-hour Model

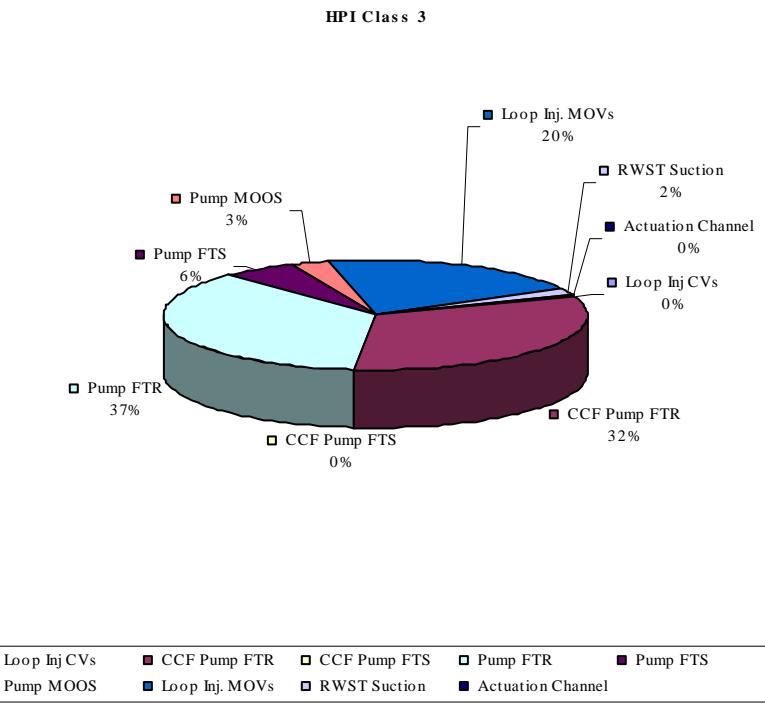

[Figure 12](#) through [Figure 17](#) show the distributions of segment importances for the 8-hour model. The pump fail-to-run and common-cause fail to run segment importances are the highest contributors for each of the design classes except Design Class 6. Design Class 6 (which has the lowest unreliability) shows the RWST suction failure as the most important segment because other, more likely, failures of pumps and valves do not apply since there is a running pump.

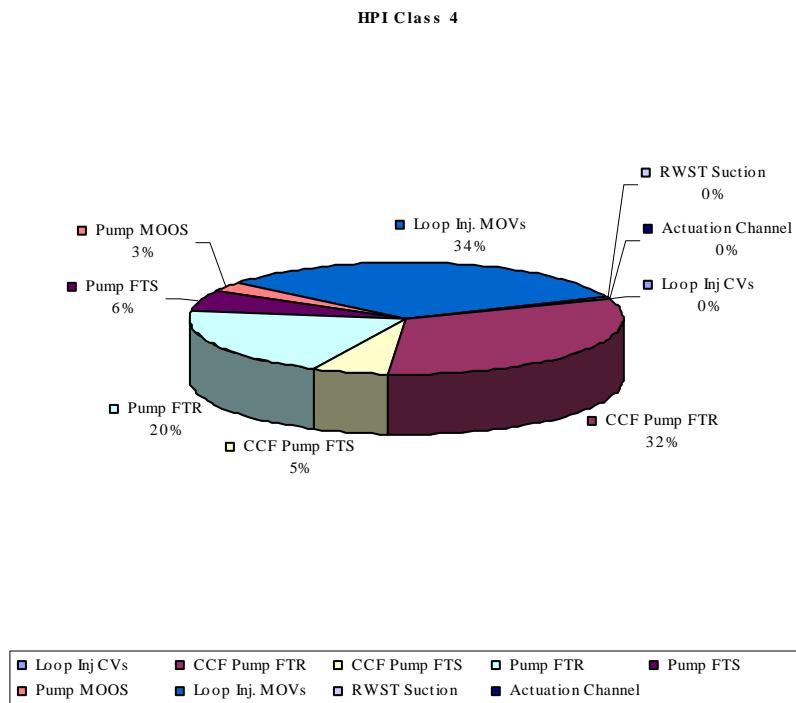

**Figure 12.** Segment importance distribution, 8-hour mission Design Class 1.

**Figure 13.** Segment importance distribution, 8-hour mission Design Class 2.

## **3.2 Failure Cause and Discovery Method Summary**

The raw failure data were sliced to show the distribution of the failure causes and the discovery methods by the affected segment.

### **3.2.1 Leading Segment Failures**

The pump (79%) and the actuation circuit (9%) were the leading segment failures identified in the database. See [Table 5](#). [Table 6](#) shows the description of the discovery method and whether that discovery method is used in the calculations.

### **3.2.2 Leading Discovery Methods**

Periodic surveillance (27%) and Non-SI demand (27%) were the leading methods of discovery. See [Table 5](#).

### **3.2.3 Leading Causes of Failure**

Fifty-two percent of the failures of the HPI system observed in the experience were attributed to hardware-related problems. Personnel errors led to 24% of all HPI segment failures. However, half of those failures were immediately identified and either recovered or were recoverable, meaning that the failures were of the nature where plant personnel were able to respond to the failures immediately after they occurred. See [Table 7](#).

**Table 5. Comparison of failed segment with the method of discovery.<sup>2</sup>**

Segment	SI Demand	non-SI Demand	Alarm/ indicator	Inspection/ review	Other (not counted) surveillance test	Periodic surveillance	Total	Percent
Actuation Circuit	3						3	9%
Motor		1					1	3%
Other						1	1	3%
Pump	1	8	7	1	1	8	26	79%
Valve	1				1		2	6%
Total	5	9	7	1	2	9	33	100%
Percent	15%	27%	21%	3%	6%	27%		100%

**Table 6. Discovery method description.**

Discovery Method	Description	Used in the Failure Calculations
SI Demand	The failure was discovered during a safety injection demand.	✓
Non-SI Demand	The failure was discovered during any other type of demand than SI.	
Periodic surveillance on subject system	Normally scheduled surveillances. These surveillances are to satisfy scheduled Technical Specification requirements.	✓
Inspection/review	The failure was discovered during operator duties such as walk downs, inspections, etc.	
Alarm/indicator	The failure was evidenced by an alarm or by other indications.	
Other (not counted) surveillance test	All others discovered by testing.	

<sup>2</sup> The discovery method is the activity that is ongoing at the time of the failure.

**Table 7. Comparison of failed segment and failure cause.<sup>3</sup>**

Segment	Design	Gas Binding	Hardware	Maintenance	Personnel	Procedure	Total	Percent
Actuation Circuit	1		1		1		3	9%
Motor			1				1	3%
Other			1				1	3%
Pump	1	4	13	1	6	1	26	79%
Valve			1		1		2	6%
Total	2	4	17	1	8	1	33	100%
Percent	6%	12%	52%	3%	24%	3%	100%	

- Contamination—The failure was the result of foreign material affecting the component.
- Design—The failure was the result of a flawed design.
- Hardware—The failure was the result of some aspect of the equipment. Typically, this is used for normal wear of the component.
- Personnel—The failure was the result of personnel error, by either commission or omission.
- Procedure—The failure was the result of an incorrect procedure.
- Gas Binding—The failure was the result of gases coming out of solution in the pump suction. This cause is used only in the HPI study.
- Maintenance—The failure was the result of improper maintenance.

<sup>3</sup> The cause of the failure is assigned to a broadly defined cause classification. The cause classifications are design, environment, hardware (e.g., aging, wear, manufacturing defects), personnel, and procedure. The cause classification assigned is based on the immediate cause of the failure and not the root cause. Generally, root cause is only determined through a detailed investigation and analysis of the failure. Specifically, the mechanism that actually resulted in the failure of the segment or component is captured as the cause.

## 4 DATA TABLES

### 4.1 Data Tables for Unreliability and Unavailability Trends

**Table 8.** Plot data table for HPI system unavailability, FTS model. [Figure 2](#)

FY	Plot Trend Error Bar Points			Regression Curve Data Points

## **5 DESIGN-CLASSES**

Differences within a design class due to system configuration were categorized first by number of steam generators (SGs) (which correlates to cold legs) and then by number of HPI pump trains. [Table 11](#) shows individual plant configurations and the design class they have been assigned.

**Table 11. Listing of the HPI design classes, Units associated with each design class, the number and type of HPI trains, the number of cold-legs, and the success criterion for a small LOCA (as stated in the IPEs).**

HPI Class	Plant	Centrifugal Charging Pumps (CCP)	Intermediate Head Safety Injection Pumps (IHSI)	Total High-Pressure Motor Trains	IHSI and CCP for ES Auto or Immediate Manual Start	Cold Leg Injection Paths	Steam Generators	Small LOCA success for HPI (injection phase)
1	Arkansas Nuclear One 2	—	3 (1 swing pump never operates unless one of the two is in maintenance)	3	2	4	2	1/3 pumps; 2/4 injection paths
1	Calvert Cliffs 1 & 2	—	3 (backup pump requires operator)	3	2	4	2	1/2 pumps to 2/4 injection paths;
1	Davis-Besse	—	2	2	2	4	2	1/2 HPI pumps and flow to associated R/X nozzle
1	Keweenaw	—	2	2	2	2	2	1/2 HPIs to 1/2 cold legs, also allow for manual start of comp that didn't auto start
1	Millstone 2	—	3 (one pump is a swing pump that requires operator)	3	2	8; 4 per sys	2	1/3 HPIs to 3 of 3 unfaulted loops OR 2/3 HPI supplying 2/3 unfaulted loops
1	Palisades	—	2	2	2	4	2	1/2 HPIs to 1/3 intact headers; assume SBLOCA fails fourth header
1	Palo Verde 1, 2, & 3	—	2	2	2	4	2	1/2 HPIs to 3/6 injection headers that feed the 3 RCS SI cold legs; SBLOCA assumed to fault one cold leg path
1	Point Beach 1 & 2	—	2	2	2	2	2	1/2 HPIs to the unfaulted loop initially takes suction from BAST then auto switch to RWST
1	Prairie Island 1 & 2	—	2	2	2	2	2	1/2 HPIs to 1/2 cold legs
1	San Onofre 1 <sup>4</sup> , 2, & 3	—	3 (one requires operator to manual realign)	3	2	4	2	1/3 HPIs to 2/4 cold legs
1	St. Lucie 1 & 2	—	2	2	2	4	2	1/2 HPIs to 1/4 cold legs

<sup>4</sup> Decommissioned November 1992.

HPI Class	Plant	Centrifugal Charging Pumps (CCP)	Intermediate Head Safety Injection Pumps (IHHSI)	Total High-Pressure Motor Trains	IHSI and CCP for ES Auto or Immediate Manual Start	Cold Leg Injection Paths	Steam Generators	Small LOCA success for HPI (injection phase)
		—	3 (one needs operator; installed spare)	3	2	4	2	1/2 HPIs to 2 intact cold leg injection paths
1	Waterford 3	—	3 (one needs operator; installed spare)	3	2	4	2	1/2 HPIs to 2 intact cold leg injection paths
2	Arkansas Nuclear One 1	3 (1 pump running; 1 swing pump never operates unless one of the two is in maintenance)	—	3	2	4	2	1/3 pumps; 2/4 injection paths; the swing pump has to be manually aligned to EDG and SW
2	Crystal River 3	3 (1 pump running)	—	3	3	4	2	1/3 MUPs to 1/4 injection paths
2	Fort Calhoun	—	3	3	3	4	2	1/3 HPI to 2/4 legs
2	Ginna	—	3	3	3	2	2	1/3 HPI to 1/2 legs
2	Oconee 1, 2, & 3	3 (1 pump running)	—	3	3	4	2	1/3 HPIs to 1/4 RCS injection nozzles
2	Three Mile Island 1	3 (1 pump running)	—	3	3	4	2	1/3 HPIs through 1/4 injection paths
3	Beaver Valley 1 & 2	3 (1 pump spare)	—	3	2	3	3	1/3 Charging/HHSI pumps to 3/3 cold legs; model as 1/2CCPs to 3/3 cold legs since spare pump is unpowered
3	Farley 1 & 2	3 (serves as HPI; one requires operator)	—	3	2	3	3	1/2 HPI pumps to 2/3 cold legs for 4 hours; 1 normally operating, 1 in standby, 1 as backup to be aligned if one of the others is not available
3	H.B. Robinson	—	3 (1 pump breaker is racked out)	2	2	3	3	1/2 HPIs; 1 HPI pump is at time of IPE undergoing major overhaul hence disabled.
3	Maine Yankee <sup>5</sup>	3 (1 pump run, 1 pump standby, 1 pump spare)	—	3	2	3	3	1/2 HPSI trains to 1/2 intact cold water loops from RWST; no credit for spare

<sup>5</sup> Decommissioned August 1997.

HPI Class	Plant	Centrifugal Charging Pumps (CCP)	Intermediate Head Safety Injection Pumps (IHSI)	Total High-Pressure Motor Trains	IHSI and CCP for ES Auto or Immediate Manual Start	Cold Leg Injection Paths	Steam Generators	Small LOCA success for HPI (injection phase)
3	North Anna 1 & 2	3 (1 pump running; 1 needs operator)	—	3	2	3	3	1/3 HHIs; model as 1/2 HHIs since third pump needs manual alignment
3	Shearon Harris 1	3 (1 pump running; 1 pump spare)	—	3	2	3	3	1/2 HPIs *(one normally operating; have a spare pump that can be available in 8 hours)
3	Summer 1	3 (1 pump running; 1 pump breaker is racked out)	—	3	2	3	3	1/2 HPSIs to 2/3 cold legs
3	Surry 1 & 2	3 (1 pump is in "pull-to -lock")	—	3	2	3	3	1/3 HHSIs to 1/3 cold legs; HHSI limited to simultaneous operation of 2 of 3 HHSI pumps
4	Turkey Point 3 & 4	—	4 (2 per unit)	4 (2 per unit)	2	3	3	2/4 HHSI trains to 1/3 cold legs; taking credit for other units pumps
5	Indian Point 2	—	3	3	3	4	4	1/3 HPIs to 1/4 cold legs
5	Indian Point 3	—	3	3	3	8	4	1/3 HPIs to 1/4 cold legs
5	South Texas 1 & 2	—	3	3	3	3	4	1/3 HPSIs to 1/3 cold legs
6	Braidwood 1&2	2	2	4	4	8; 4per sys	4	1/4 CC or SI pumps to 2/4 injection paths
6	Byron 1 & 2	2	2	4	4	8; 4per sys	4	1/4 CC or SI pumps to 2/4 injection paths
6	Callaway	2	2	4	4	8; 4per sys	4	1/4 CC or SI pumps to 2/4 injection paths
6	Catawba 1 & 2	2 (1 pump running)	2	4	4	8; 4per sys	4	1/4 NI or NV pumps to 2/4 injection paths
6	Comanche Peak 1 & 2	2	2	4	4	8; 4per sys	4	1/4 pumps to 2/4 injection paths
6	Cook 1 & 2	2	2	4	4	8; 4per sys	4	1/2 CCPs AND 1/2 SI pumps to 1/3 intact loops
6	Diablo Canyon 1 & 2	2	2	4	4	8; 4per sys	4	1/4 CCPs or SI pumps to 1/4 RCS cold legs

HPI Class	Plant	Centrifugal Charging Pumps (CCP)	Intermediate Head Safety Injection Pumps (IHSI)	Total High-Pressure Motor Trains	IHSI and CCP for ES Auto or Immediate Manual Start	Cold Leg Injection Paths	Steam Generators	Small LOCA success for HPI (injection phase)
6	Haddam Neck <sup>6</sup>	2	2	4	4	5	4	(1/2 HPIs to 3 of 3 unfaulted legs OR 2/2 HPIs to 2 of 3 unfaulted legs) AND 1/2 CCPs to # 2 cold leg
6	McGuire 1 & 2	2 (1 pump running)	2	4	4	8; 4per sys	4	1/4 CC or SI pumps to 2/4 injection paths
6	Millstone 3	3 (1 pump running, 1 needs operator)	2	5	4	8; 4per sys	4	1/4 HPIs to 3/3 unfaulted RCS cold legs
6	Salem 1 & 2	2	2	4	4	8; 4per sys	4	1/4 centrifugal charging or SJS pumps
6	Seabrook	2	2	4	4	8; 4per sys	4	1/4 HPI trains (SI or CVCS) to 2/4 cold legs
6	Sequoyah 1 & 2	2	2	4	4	8; 4per sys	4	1/4 HPI trains (SI or CVCS) to 2/4 cold legs
6	Vogtle 1 & 2	2 (1 pump running)	2	4	4	8; 4per sys	4	1/2 CCPs through 3/4 cold legs for 3 hrs. OR 1/2 SIs through 3/4 cold legs for 6 hours
6	Watts Bar	2	2	4	4	8; 4per sys	4	1/4 HPS is to 3/4 cold legs
6	Wolf Creek	2	2	4	4	8; 4per sys	4	1/4 HPS is to 3/4 cold legs
6	Zion <sup>7</sup> & 2 <sup>8</sup>	2 (1 pump running)	2	4	4	8; 4per sys	4	1 CCP (high-pressure) or 1 SIP (medium pressure)

<sup>6</sup> Decommissioned August 1997.

<sup>7</sup> Decommissioned December 1997.

<sup>8</sup> Decommissioned December 1997.
